

## About Dot Net Builders

---

Dot Net Builders, Microsoft Certified Partner and member of the Visual Studio Integration Program, specializes in application development for the Microsoft .NET platform. Their expertise in Model Driven Architecture is directed towards creating bespoke Windows and Web applications, using model driven rapid application development tools and methodologies. Their own .NET development tool, Constructor(), enables them to quickly model, design and create robust, scalable and secure solutions, based on accepted industry standards, providing a greater return on investment to clients.

## About Constructor()

---

Dot Net Builders Constructor() is a set of Model Driven tools, based on the Object Management Group's Meta-Object Facility specification, which facilitate rapid application development driven from a UML model. Constructor() is fully integrated into Visual Studio .NET. By automating the tasks of turning a business model into an application, and by providing a complete object and data framework, development times are significantly reduced. With the functionality for importing and maintaining a model together with the generation of application code, user interfaces and DDL script, Constructor() makes developing systems for the .NET environment effortless.
