

DOCsec 2000 Abstract

A Risk Averse Methodology to Rapidly Introduce the Latest Middleware while leveraging legacy data

Introducing emerging technologies like middleware and business components is not easy. Companies have tried various approaches -- some have succeeded and some have failed. In this session you will be presented with a risk averse methodology covering business, technical, organizational and process aspects as it delivers successful security projects on the way. It has succeeded for dozens of organizations and has evolved in over 12 years to be pragmatically focused and streamlined to produce success in less than 6 months per project. Iterative and incremental in nature, it requires a lot of hard work by your development and business analyst teams, but it works.

Duration: 1 hour

Audience: Technical Managers

Speaker: Viktor Ohnjec
