USE OF SPECIFICATION - TERMS, CONDITIONS & NOTICES

The material in this document details an Object Management Group specification in accordance with the terms, conditions and notices set forth below. This document does not represent a commitment to implement any portion of this specification in any company's products. The information contained in this document is subject to change without notice.

LICENSES

The companies listed above have granted to the Object Management Group, Inc. (OMG) a nonexclusive, royalty-free, paid up, worldwide license to copy and distribute this document and to modify this document and distribute copies of the modified version. Each of the copyright holders listed above has agreed that no person shall be deemed to have infringed the copyright in the included material of any such copyright holder by reason of having used the specification set forth herein or having conformed any computer software to the specification.

Subject to all of the terms and conditions below, the owners of the copyright in this specification hereby grant you a fully-paid up, non-exclusive, nontransferable, perpetual, worldwide license (without the right to sublicense), to use this specification to create and distribute software and special purpose specifications that are based upon this specification, and to use, copy, and distribute this specification as provided under the Copyright Act; provided that: (1) both the copyright notice identified above and this permission notice appear on any copies of this specification; (2) the use of the specifications is for informational purposes and will not be copied or posted on any network computer or broadcast in any media and will not be otherwise resold or transferred for commercial purposes; and (3) no modifications are made to this specification. This limited permission automatically terminates without notice if you breach any of these terms or conditions. Upon termination, you will destroy immediately any copies of the specifications in your possession or control.

PATENTS

The attention of adopters is directed to the possibility that compliance with or adoption of OMG specifications may require use of an invention covered by patent rights. OMG shall not be responsible for identifying patents for which a license may be required by any OMG specification, or for conducting legal inquiries into the legal validity or scope of those patents that are brought to its attention. OMG specifications are prospective and advisory only. Prospective users are responsible for protecting themselves against liability for infringement of patents.

GENERAL USE RESTRICTIONS

Any unauthorized use of this specification may violate copyright laws, trademark laws, and communications regulations and statutes. This document contains information which is protected by copyright. All Rights Reserved. No part of this work covered by copyright herein may be reproduced or used in any form or by any means--graphic, electronic, or mechanical, including photocopying, recording, taping, or information storage and retrieval systems--without permission of the copyright owner.
DISCLAIMER OF WARRANTY

WHILE THIS PUBLICATION IS BELIEVED TO BE ACCURATE, IT IS PROVIDED "AS IS" AND MAY CONTAIN ERRORS OR MISPRINTS. THE OBJECT MANAGEMENT GROUP AND THE COMPANIES LISTED ABOVE MAKE NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS PUBLICATION, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF TITLE OR OWNERSHIP, IMPLIED WARRANTY OF MERCHANTABILITY OR WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR USE. IN NO EVENT SHALL THE OBJECT MANAGEMENT GROUP OR ANY OF THE COMPANIES LISTED ABOVE BE LIABLE FOR ERRORS CONTAINED HEREIN OR FOR DIRECT, INDIRECT, INCIDENTAL, SPECIAL, CONSEQUENTIAL, RELIANCE OR COVER DAMAGES, INCLUDING LOSS OF PROFITS, REVENUE, DATA OR USE, INCURRED BY ANY USER OR ANY THIRD PARTY IN CONNECTION WITH THE FURNISHING, PERFORMANCE, OR USE OF THIS MATERIAL, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

The entire risk as to the quality and performance of software developed using this specification is borne by you. This disclaimer of warranty constitutes an essential part of the license granted to you to use this specification.

RESTRICTED RIGHTS LEGEND

Use, duplication or disclosure by the U.S. Government is subject to the restrictions set forth in subparagraph (c) (1) (ii) of The Rights in Technical Data and Computer Software Clause at DFARS 252.227-7013 or in subparagraph (c)(1) and (2) of the Commercial Computer Software - Restricted Rights clauses at 48 C.F.R. 52.227-19 or as specified in 48 C.F.R. 227-7202-2 of the DoD F.A.R. Supplement and its successors, or as specified in 48 C.F.R. 12.212 of the Federal Acquisition Regulations and its successors, as applicable. The specification copyright owners are as indicated above and may be contacted through the Object Management Group, 109 Highland Avenue, Needham, MA 02494, U.S.A.

TRADEMARKS

IMM®, MDA®, Model Driven Architecture®, UML®, UML Cube logo®, OMG Logo®, CORBA® and XMI® are registered trademarks of the Object Management Group, Inc., and Object Management Group™, OMG™, Unified Modeling Language™, Model Driven Architecture Logo™, Model Driven Architecture Diagram™, CORBA logos™, XMI Logo™, CWM™, CWM Logo™, IIOP™, MOF™, OMG Interface Definition Language (IDL)™, and OMG SysML™ are trademarks of the Object Management Group. All other products or company names mentioned are used for identification purposes only, and may be trademarks of their respective owners.
COMPLIANCE

The copyright holders listed above acknowledge that the Object Management Group (acting itself or through its designees) is and shall at all times be the sole entity that may authorize developers, suppliers and sellers of computer software to use certification marks, trademarks or other special designations to indicate compliance with these materials.

Software developed under the terms of this license may claim compliance or conformance with this specification if and only if the software compliance is of a nature fully matching the applicable compliance points as stated in the specification. Software developed only partially matching the applicable compliance points may claim only that the software was based on this specification, but may not claim compliance or conformance with this specification. In the event that testing suites are implemented or approved by Object Management Group, Inc., software developed using this specification may claim compliance or conformance with the specification only if the software satisfactorily completes the testing suites.

OMG's Issue Reporting

All OMG specifications are subject to continuous review and improvement. As part of this process we encourage readers to report any ambiguities, inconsistencies, or inaccuracies they may find by completing the Issue Reporting Form listed on the main web page http://www.omg.org, under Documents, Report a Bug/Issue (http://www.omg.org/report_issue.htm.)

Financial Instrument Global Identifier, v1.1 Beta 2
Preface

OMG

Founded in 1989, the Object Management Group, Inc. (OMG) is an open membership, not-for-profit computer industry standards consortium that produces and maintains computer industry specifications for interoperable, portable, and reusable enterprise applications in distributed, heterogeneous environments. Membership includes Information Technology vendors, end users, government agencies, and academia.

OMG member companies write, adopt, and maintain its specifications following a mature, open process. OMG’s specifications implement the Model Driven Architecture® (MDA®), maximizing ROI through a full-lifecycle approach to enterprise integration that covers multiple operating systems, programming languages, middleware and networking infrastructures, and software development environments. OMG’s specifications include: UML® (Unified Modeling Language™); CORBA® (Common Object Request Broker Architecture); CWM™ (Common Warehouse Metamodel); and industry-specific standards for dozens of vertical markets.

More information on the OMG is available at http://www.omg.org/.
OMG Specifications
As noted, OMG specifications address middleware, modeling and vertical domain frameworks. All OMG Specifications are available from the OMG website at:

http://www.omg.org/spec

Specifications are organized by the following categories:

Business Modeling Specifications

Middleware Specifications
- CORBA/IIOP
- Data Distribution Services
- Specialized CORBA

IDL/Language Mapping Specifications

Modeling and Metadata Specifications
- UML, MOF, CWM, XMI
- UML Profile

Modernization Specifications

Platform Independent Model (PIM), Platform Specific Model (PSM), Interface Specifications
- CORBA Services
- CORBA Facilities

OMG Domain Specifications

CORBA Embedded Intelligence Specifications

CORBA Security Specifications

Signal and Image Processing Specifications

All of OMG’s formal specifications may be downloaded without charge from our website. (Products implementing OMG specifications are available from individual suppliers.) Copies of specifications, available in PostScript and PDF format, may be obtained from the Specifications Catalog cited above or by contacting the Object Management Group, Inc. at:

OMG Headquarters
109 Highland Avenue
Needham, MA 02494
USA
Tel: +1-781-444-0404
Fax: +1-781-444-0320
Email: pubs@omg.org
Certain OMG specifications are also available as ISO standards. Please consult http://www.iso.org

**Typographical Conventions**

The type styles shown below are used in this document to distinguish programming statements from ordinary English. However, these conventions are not used in tables or headings where no distinction is necessary.

*Times/Times New Roman - 10 pt.:* Standard body text, table text, bullets

**Helvetica/Arial – 9 or 10 pt. Bold:** OMG Interface Definition Language (OMG IDL) and syntax elements.

**Courier new/Courier – 10 pt. Bold:** Programming Languages

**Helvetica/Arial – 10 pt.:** Exceptions

**Courier/Courier New – 9**

**Issues**

The reader is encouraged to report any technical or editing issues/problems with this specification to http://www.omg.org/report_issue.htm.
1 Scope

1.1 Overview

The development of the Financial Instrument Global Identifier originated from a need for a standard methodology to bridge across multiple identification systems for financial instruments. Without prejudice against any existing symbol-based solutions, or any question of the validity of one system over the other, the FIGI standard utilizes a metadata driven approach to enable the unique and persistent identification of financial instruments. In so doing, while employing the principles of open data, it provides a mechanism for interoperability between existing identification systems.

This specification lays out the details of the Financial Instrument Global Identifier across two dimensions:

1. The standard of the structure of the Global Identifier itself—what is/is not valid as a Global Identifier and how a Global Identifier is constructed and validated;
2. An ontological model specifying the relationship between the Global Identifier and other closely related information.

This specification has been created with the clear understanding that a published interface for creating identifiers and linking together relevant parties, e.g., Certified Providers or the Registration Authority, through the use of technology is a critical part of the implementation of this standard. While high level descriptions of the various types of organizations that need to be involved as well as high level descriptions of the interactions between such organizations has been included in this document, they are included on the understanding that there will need to be a subsequent specification produced that details the necessary technical infrastructures and service level agreements for all participating organizations. To be clear, the technical specification of those services and service level agreements is out of scope for this document.

Global Identifier concepts are documented using two forms of definition:

1. A structured ontology specification of the concept, and its relationships to others, represented using the Web Ontology Language (OWL), in the form of (a) RDF/XML serialized OWL, (b) ODM (Ontology Definition Metamodel)-compliant ODM XML, and (c) ODM-compliant UML XMI.
2. Natural language definitions which represent the concepts in natural language using the vocabulary of the finance industry.
3. Two controlled vocabularies in rdf format, one specifying the list of possible values for security types, one specifying the list of possible values for pricing sources. These lists are subject to growth over time as new security types are either invented or incorporated into FIGI and as new pricing sources are taken into account.

This specification covers both the content of the models, and the underlying architecture employed for producing and presenting the model.

This model is developed from a previously existing infrastructure that had issued in excess of 150 million FIGI-compliant identifiers as of the 2014 OMG publication of the original standard. The purpose of this specification is to specify the structure of the Identifier itself and its relationship to key information elements rather than to specify the technology and related interfaces used to generate, access, and manage the identifiers.
2 Conformance

2.1 Introduction

An identifier is in conformance with this standard if, and only if, all of the following conditions are met:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax of identifier.</td>
<td>The identifier shall be a twelve (12) character string as follows:</td>
<td>Sub clause 6.2.1 Introduction</td>
</tr>
<tr>
<td></td>
<td>Position 1: any upper case alphabetical character excluding vowels (but including “Y”). Position 2: any upper case alphabetical character excluding vowels (but including “Y”). Position 3: the letter “G”. Positions 4-11: any alpha numeric character excluding vowels (but including “Y”) that in combination with positions 1 and 2 does not constitute a duplicate of an existing string. Position 12: check digit (see section 6.1.2 for algorithm). Qualification: positions 1 and 2 cannot be the following sequences: BS, BM, GG, GB, VG.</td>
<td></td>
</tr>
<tr>
<td>Uniqueness of identifier.</td>
<td>The identifier shall be a twelve character string, as specified above, that has never been assigned as a Financial Instrument Global Identifier.</td>
<td>Sub clause 6.2.1 Introduction</td>
</tr>
<tr>
<td>Composite Global Identifier</td>
<td>If a global identifier is to be designated as a Composite Global Identifier, it shall have at least one Global identifier associated with it.</td>
<td>Sub clause 6.2.1 Introduction</td>
</tr>
<tr>
<td>Share Class Global Identifier</td>
<td>If a global identifier is to be designated as a Share Class Global Identifier, it shall have at least one Composite Global identifier associated with it.</td>
<td>Sub clause 6.2.1 Introduction</td>
</tr>
<tr>
<td>Exchange Code</td>
<td>A global identifier shall have either zero (0) or one (1) exchange code associated with it.</td>
<td>Sub clause 6.2.2 Exchange Code</td>
</tr>
</tbody>
</table>

### Financial Instrument Global Identifier, v1.1

#### Beta 2

#### Pricing Source

A global identifier must have any finite number of pricing sources, including zero (0) associated with it.

Sub clause 6.2.4 Pricing Source

| Financial Instrument Name | Each global identifier shall have at least one name, which need not be unique to the identifier. | Sub clause 6.2.3 Financial Instrument Name
|----------------------------|---------------------------------------------------------------------------------|----------------------------------|
| Ticker | A global identifier shall have at least one ticker associated with it. That ticker need not be unique to the identifier. | Sub clause 6.2.6 Ticker

| Security Type | A global identifier shall be associated with at least one (1) Security Type. | Sub clause 6.2.5 Security Type
|----------------|---------------------------------------------------------------------------------|----------------------------------|

#### There are no degrees of conformance.

### 2.2 Conformance as a Provider of Identifiers

#### 2.2.1 Background & Approach

In order to support the accurate assignment of identifiers it is vital that a single financial instrument, appropriately understood, be identified by exactly one identifier. Further, it shall be the case that a particular identifier, unless it is a composite or share class identifier (see Clause 6 below), identifies exactly one financial instrument. In order to support this, there are two basic conditions that shall be met:

- **Uniqueness of Identifier**: the twelve character string (see Clause 6 for details) is unique and has never been used at any time for a FIGI.
- **Uniqueness of the Financial Instrument**: the financial instrument being identified does not already have a FIGI associated with it.

In order to ensure these two conditions, there are multiple approaches that could be taken. In the case of the FIGI, the approach that is taken is to have a single Registration Authority and therefore, a single system of record globally. By having a single system of record, the possibility that one instrument is assigned multiple FIGIs or a single FIGI is assigned to multiple instruments (qualifications for groupings notwithstanding) is greatly minimized. To that end, the following distinctions need to be made:

- **Registration Authority (RA)**: the Registration authority serves as both an issuer of Identifiers and as a comprehensive system of record of the registered Identifiers.
  - The organization that will serve as the Registration Authority shall be specified by the Financial Services Domain Task Force (FSDTF) of the OMG.
- **Certified Provider (CP)**: a Certified Provider (there can potentially be many) serves as an issuer of Identifiers and can elect to maintain a comprehensive inventory of Identifiers for their own purposes.
  - Each CP shall elect an unused two consonant prefix to be used as the first two characters of the identifiers that they create.
The details on restrictions that pertain to assignment of two letter prefixes are documented in Section 8.2.4. See Informative Annex C for background information regarding two letter prefixes. Examples of how new Identifiers can be created, either by a CP or through a request service, is documented in Informative Annex B. More information on ways the RA and CP can interact is also provided in Informative Annex B.

2.2.2 Conformance

In order to conform to this specification, a Certified Provider shall be required to:

- Specify only identifiers that are compliant with the technical specifications of the identifier as specified in Clause 6.
- Specify only identifiers that begin with the two letter prefix that is assigned to their organization as per the restrictions documented in Section 8.2.4. More background information on the process is outlined in Informative Annex C.
- Take reasonable steps to ensure that each identifier they issue is unique within their assigned domain of possible identifiers.
- Provide an appropriate description of the financial instrument, which may vary according to the type of financial instrument, so as to provide the Registration Authority the ability to confirm the uniqueness of the instrument.

2.3 Conformance as a Consuming Application

A consuming application is in conformance with this standard provided that it is configured to ingest and store a syntactically correct Financial Instrument Global Identifier, a Composite Global Identifier, and a Share Class Global Identifier. Optionally, a consuming application may, but is not required to, ingest and store any or all of the remaining data points associated with an Identifier, e.g., the associated definition.

Financial Instrument Global Identifier, v1.1 Beta 2
4 Terms and Definitions

4.1 Specific Terminology

The human readable definitions have been constructed by and with the input of business subject matter experts. In cases where there are Financial Industry Business Ontology (FIBO) definitions available either the FIBO definitions were used or they were incorporated into the formal definitions.

For the purposes of this specification, the following terms and definitions apply.

Ontology
Definition: A formalization of a conceptualization. For the purposes of this specification the formalization is in OWL and the conceptualization is that of business subject matter specific to the identification of financial instruments.

Taxonomy
Definition: A set of terms which stand in some classification relation to one another.

Vocabulary
Definition: A set of words, each giving one or more formal definitions which apply to a meaningful concept that is referred to by that word.

4.2 Financial Terms

Financial Instrument
Definition: Financial instruments are cash, evidence of an ownership interest in an entity, or a contractual right to receive, or deliver, cash or another financial instrument.

Cash Instrument
Definition: Cash instruments are financial instruments whose value is determined directly by markets. They can be divided into securities, which are readily transferable, and other cash instruments such as loans and deposits, where both borrower and lender have to agree on a transfer.

Derivative Instrument
Definition: Derivative instruments are financial instruments which derive their value from the value and characteristics of one or more underlying assets. They can be divided into exchange-traded derivatives and over-the-counter (OTC) derivatives.

4.3 Identifier

In general terms, an Identifier can be understood as follows:

An identifier is a name that identifies (that is, labels the identity of) either a unique object or a unique class of objects, where the "object" or class may be an idea, physical [countable] object (or class thereof), or physical

Financial Instrument Global Identifier, v1.1 Beta 2
[noncountable] substance (or class thereof). The abbreviation ID often refers to identity, identification (the process of identifying), or an identifier (that is, an instance of identification). An identifier may be a word, number, letter, symbol, or any combination of those.

The words, numbers, letters, or symbols may follow an encoding system (wherein letters, digits, words, or symbols stand for ideas or longer names) or they may simply be arbitrary. When an identifier follows an encoding system, it is often referred to as a code or ID code. Identifiers that do not follow any encoding scheme are often said to be arbitrary IDs; they are arbitrarily assigned and have no greater meaning. (Sometimes identifiers are called "codes" even when they are actually arbitrary, whether because the speaker believes that they have deeper meaning or simply because they are speaking casually and imprecisely.)

The above definition is general and applies to a range of items in this specification including Financial Instrument Names and Financial Instrument Identifiers. A more precise definition is, however, called for with respect to Financial Instrument Global Identifiers.

For the purposes of this specification an identifier when applied to the FIGI is understood as:

**Definition:** A unique string of characters which is semantically meaningless, but adheres to specific syntax restrictions.

An important term used above is defined below.

**Unique:**

An item is unique if, and only if, within its domain, understood in this context to include all and only FIGIs, it does not duplicate any other item either currently or historically specified as an identifier within the domain where “duplicate” means consisting of exactly the same twelve characters in exactly the same order.

Uniqueness does not apply across domains. That is to say, that there is no guarantee that a given string may not be used as an Identifier outside of FIGI. That said, considerable effort was employed to reduce the chances that a given Identifier would not be a duplicate of another Identifier within the financial domain.

To say that the identifier is semantically meaningless is to say that, beyond syntax restrictions, the assignment of characters to given positions within the twelve character string is entirely without semantic content. The only exceptions to this clause are slight restrictions to which two letters can occupy the first two positions, the letter that shall occupy the third position, and the value of the last character, which is a calculated, though still meaningless, check digit.
5 Symbols and Abbreviations

5.1 Symbols
There are no symbols introduced by this specification.

5.2 Abbreviations
The following abbreviations are used throughout this specification:

- FIBO – Financial Industry Business Ontology
- FIGI – Financial Instrument Global Identifier
- ISIN – International Securities Identification Number
- ODM – Ontology Definition Metamodel
- OWL – Web Ontology Language
- RDF – Resource Definition Framework
- SME – Subject Matter Expert
- UML – Unified Modeling Language
- URL – Uniform Resource Locator
- XMI – XML Metadata Interchange
- XML – eXtensible Markup Language

Additional symbols and abbreviations that are used only in annexes to this specification are given in those annexes.
This page intentionally left blank.
6 Architecture

6.1 Global Identifier Structure

6.1.1 Introduction

A Financial Instrument Global Identifier is structured as a twelve (12) character string which is semantically meaningless. As the string is intended to remain attached to a given financial instrument throughout the life of that instrument in addition to serving as a historical reference for retired/obsolete financial instruments, the string shall be structured in such a way as to be semantically neutral.

Owing to the granularity of the Financial Instrument Identifier, there is a need for multiple types of identifiers so as to provide groupings of Financial Instruments. The three types of Financial Instrument Global Identifiers are as follows:

- Global Identifier: this is the most basic type of identifier that applies to exactly and only one Financial Instrument at the most granular level. For example, AAPL common stock as traded on NASDAQ Global Select. The granularity of this identifier is found in that which it identifies. In particular, the most basic FIGI identifies a financial instrument, where applicable, at the trading venue level. That is, where applicable, the Global Identifier identifies a Financial Instrument within the context of a venue.

- Composite Global Identifier: The Composite Global Identifier is itself a Global Identifier which is differentiated from a “normal” Global Identifier in that it serves as a parent in a hierarchy of individual Global Identifiers. For example, AAPL common stock, US Composite. The purpose of this “version” of the identifier is to group individual identifiers, as per above, into groupings at the country level. This is not, however, merely a grouping of financial instruments. Rather, a Composite Global Identifier identifies a unique financial instrument within the context of a country.

The Composite Global Identifier only applies to a limited subset of Global Identifiers. In particular, it only applies to those Global Identifiers that can be differentiated based on either the venue on which the asset is traded or the pricing source of the asset.

- Share Class Global Identifier: The Share Class Global Identifier is itself a Global Identifier which is differentiated from a “normal” Global Identifier and a Composite Global Identifier in that it serves as a parent in a hierarchy of individual Composite Global Identifiers. For example, AAPL common stock, US Composite. The purpose of this “version” of the identifier is to group individual identifiers, as per above, into groupings at the country level. This is not, however, merely a grouping of financial instruments. Rather, a Composite Global Identifier identifies a unique financial instrument within the context of a country.

The Share Class Global Identifier only applies to a limited subset of Global Identifiers. In particular, it only applies to those Global Identifiers that can be differentiated based on either the venue on which the asset is traded or the pricing source of the asset.

All three types of Financial Instrument Identifiers have exactly the same structure and syntax restrictions as specified below.

6.1.2 Syntax

The permissible characters for use within a FIGI are a subset of ISO 8859-1 as follows:

- All upper case ISO 8859-1 consonants (including Y).

- The single digit integers 0 – 9.

While the string itself is semantically meaningless, there is a specific structure that is used. The syntax rules for the twelve characters are as follows:

- Characters 1 and 2:
  - Any combination of upper case consonants with the following exceptions:

Deleted: it is vital that
Deleted: an exchange
Deleted: exchange
Deleted: These conditions only obtain in the case of Equities. As such, the Composite Global Identifier is only used in grouping equities.
Deleted: aapl
Deleted: Like the Composite Global Identifier, the Share Class Global Identifier only applies to a limited subset of Global Identifiers. As a grouping mechanism for Composite Global Identifiers, the Share Class Global Identifier is only used in grouping equities.
Deleted: 0
BS, BM, GG, GB, GH, KY, VG The purpose of the restriction is to reduce the chances that the resulting identifier may be identical to an ISIN string. (Strictly speaking, a duplicate is not a problem as the strings designate different things, but care has been taken to reduce ambiguity.) The way that ISIN is constructed is that the first two characters correspond to the country of issuance. The third character, depending on the issuing organization is typically a numeral. However, in the case of the United Kingdom, the letter “G” is assigned. As we are using the letter “G” as our third character (see below), the only combinations that may come up within ISIN that only incorporates consonants are BSG (Bahamas), BMG (Bermuda), GGG (Guernsey), GBG (United Kingdom) and VGG (British Virgin Islands). The reason for this is that the United Kingdom issues ISIN numbers for entities within its broader jurisdiction.

The allocation of the prefixes for different Certified Providers (CPs) is specified in Annex C.

- Character 3:
  - The upper case letter G (for “global”)
- Characters 4 – 11:
  - Any combination of upper case consonants and the numerals 0 – 9
- Character 12:
  - A check digit (0 – 9) which is calculated as follows:
    - Letters are converted to integers as illustrated below. Using the first 11 characters and beginning at the last character in integer format and working right to left, every second integer is multiplied by two. The resulting string of integers (numbers greater than 10 become two separate digits) are added up. Subtract the total from the next higher integer ending in zero. If the total obtained when summing up the digits is a integer ending in zero, then the check digit is zero.

Alphabetical characters are assigned a numeric value according to the following table:

<table>
<thead>
<tr>
<th>Alphabet</th>
<th>Numeric Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>11</td>
</tr>
<tr>
<td>C</td>
<td>12</td>
</tr>
<tr>
<td>D</td>
<td>13</td>
</tr>
<tr>
<td>F</td>
<td>15</td>
</tr>
<tr>
<td>G</td>
<td>16</td>
</tr>
<tr>
<td>H</td>
<td>17</td>
</tr>
<tr>
<td>J</td>
<td>19</td>
</tr>
<tr>
<td>K</td>
<td>20</td>
</tr>
<tr>
<td>L</td>
<td>21</td>
</tr>
<tr>
<td>M</td>
<td>22</td>
</tr>
<tr>
<td>N</td>
<td>23</td>
</tr>
<tr>
<td>P</td>
<td>25</td>
</tr>
<tr>
<td>Q</td>
<td>26</td>
</tr>
<tr>
<td>R</td>
<td>27</td>
</tr>
<tr>
<td>S</td>
<td>28</td>
</tr>
<tr>
<td>T</td>
<td>29</td>
</tr>
<tr>
<td>V</td>

</tr>
</tbody>
</table>

For example, for the string BBG000BLNQ1 the calculation of the check digit would be as follows:

B  B  G  0  0  0  B  L  N  Q  1
11 11 16 0 0 0 11 21 23 26 1
convert letters to numeric value here

1 2 1 2 1 2 1 2 1 2 1
multiply every other value by 2

0
Add up the resulting values above:

\[ 1+1+2+2+1+6+0+0+1+1+4+2+2+3+5+2+1 = 34 \]

Subtracting that sum from the next highest integer ending in zero:

\[ 40 - 34 = 6 \]

Thus, the check digit = 6

The string with check digit would be BBG000BLNQ16

Similarly:

\[
\begin{array}{cccccccccccc}
N & R & G & 9 & 2 & C & 8 & 4 & S & B & 3 \\
23 & 27 & 16 & 9 & 2 & 12 & 8 & 4 & 28 & 11 & 3
\end{array}
\]

Convert letters to numeric value here:

\[
\begin{array}{cccccccccccc}
1 & 2 & 1 & 2 & 2 & 1 & 2 & 1 & 2 & 1 & 2 & 1 \\
23 & 54 & 16 & 18 & 12 & 8 & 8 & 28 & 11 & 3
\end{array}
\]

Multiply every other value by 2:

Add up the resulting values above:

\[ 2+3+5+4+1+6+1+8+2+2+4+8+8+2+8+2+3 = 71 \]

Check digit 9

The string with check digit would be NRG92C84SB39.

The provenance of the check digit is the familiar Modulus 10 algorithm developed initially by Hans Peter Luhn and described in U.S. Patent No. 2,950,048 and part of the public domain. A familiar instantiation of this algorithm is specified in ISO 6166 and is used in generating the check digit for ISIN identifiers. In this instance, a few elements of the “standard” Modulus 10 algorithm have been adjusted so as to result in a different check digit than would be present in other similarly structured identifiers, e.g., ISIN. In particular, rather than multiplying the integer value corresponding to every second character starting with the second character in the identifier by two, as is the case with this specification, the ISIN standard begins with the first character. The result is that the check digit is different in over 90% of the logically possible strings.

### 6.2 Global Identifier Associated Content

#### 6.2.1 Introduction

While the Global Identifier is at the heart of this specification, it does not exist in a vacuum. Rather, a set of complementary fields are associated with the Identifier, two of which are special instances of the Identifier itself. The need for the additional data points is largely a function of the granularity of the Global Identifier. Since the Global Identifier serves to identify financial instruments at the most granular possible level, it is very helpful to clearly specify the differentiators that constitute the granularity. To that end, a number of key data elements are associated with each Global Identifier that serve to highlight the differentiating features as well as provide additional information about the financial instrument, e.g., its name.

The following sub clauses outline the various data elements associated with the Global Identifier. The relationships between the various types are explicated in later sub clauses.

#### 6.2.2 Exchange Code

Financial instruments are, in many instances, things which can be bought or sold. The financial instruments to which the concept of Exchange Code applies are instruments bought or sold on an individual exchange. Since the Global Identifier assigns unique identifiers to financial instruments at the most granular level possible, specifying the exchange on which the individual financial instrument is traded is valuable. It is grouped, along with Pricing Source, as an associated Code. Exchange codes are associated with Financial Instruments through the “has” object property. (“has” is
used rather than a more descriptive object property such as “hasAssociatedCode” in order to leverage reasoning facilities and be “mappable” to FIBO relations.)

6.2.3 Financial Instrument Name

Financial Instrument Name is the name of the company, and sometimes including a brief description of the security. The name of an instrument may change in conjunction with corporate actions. As noted above, the Identifier associated with the instrument will not change in response to such an event. In many cases, e.g., common stock, the Financial Instrument Name also happens to be the name of the issuing body. This is not sufficient to individuate the financial instrument, however, as organizations issue financial instruments with exactly the same name but that trade on different exchanges. This is a distinction that is absent in other identifiers, but serves as an individuating characteristic for FIGI.

As it is the identifier that serves as the source of persistence through change, any changes in names are simply that, changes in names. The FIGI itself, which does not change, simply has the value of the Financial Instrument Name class change for a particular individual. Historical names are not part of the FIGI standard, though there is nothing precluding any organization from capturing and storing historical FIGI data for their own needs including, but not limited to, the Financial Instrument Name.

6.2.4 Pricing Source

The pricing source for a financial instrument is the organization or company that supplies the pricing data for the particular vehicle within the particular market, e.g., on a given exchange. It is grouped, along with Exchange Code, as an associated code. A set of individuals that are members of the class “PricingSource” are specified in an associated ontology included as part of this specification.

6.2.5 Security Type

A security type is a specific category of a financial instrument that further clarifies the nature of the instrument. For example, an Equity might be an American Depository Receipt as opposed to a Common Stock. The list of Security types is dynamic and should be expected to change over time. A set of individuals that are members of the class “SecurityType” are specified in an associated ontology included as part of this specification.

6.2.6 Ticker

A ticker is a specific identifier for a financial instrument that reflects common usage. Tickers are not, however, unique to specific exchanges or specific pricing sources. Rather, a given ticker might be associated with multiple Global Identifiers, e.g., an October 13 Put on AAPL US (Name) might have a ticker value of AAPL10/19/13 P210 yet be associated with multiple Global Identifiers owing to the diversity of exchanges on which the asset can be traded.

6.3 Relationships Among Elements

As outlined above, there are multiple information elements that are associated with a given Global Identifier. These serve to provide either context for the financial instrument or a user-friendly reference. In order to serve in these functions, however, the various classes need to stand in specific relationships with the Global Identifier. The exact natures of the relationships are specified in the associated OWL file; below is the description of those relationships. Detailed UML diagrams specifying these relationships are presented below in Clause 8. The current descriptions are intended for a business audience that may be more comfortable with explanations rather than technical diagrams.

6.3.1 Global Identifier

At the heart of this model are two things: a financial instrument and a global identifier. The Global Identifier itself is part of a group of three different types of financial instrument identifiers. As such, the Global Identifier stands in relationships to both Financial Instruments and to the other identifiers.

- Relationship to Financial Instruments:
  - A Global Identifier identifies exactly one Financial Instrument.
A Financial Instrument is identified by exactly one Financial Instrument Identifier (the parent class of the Global Identifier).

- Relationship to other Financial Instrument Identifiers:
  - A Global Identifier may have up to, but not exceeding, one Composite Global Identifier as a parent.

### 6.3.2 Composite Global Identifier

As noted above, a Composite Global Identifier is, essentially, a grouping of more granular Global Identifiers. The key differentiator is that a Composite Global Identifier has at least one “child” global identifier. As such the relationship between a Global Identifier and a Composite Global identifier is:

- Relationship to other Financial Instrument Identifiers
  - A Composite Global Identifier shall have at least one Global identifier as a child.
  - A Composite Global Identifier may have up to, but not exceeding, one Share Class Global Identifier as a parent.

### 6.3.3 Share Class Global Identifier

The relationship between a Composite Global Identifier and a Share Class Global Identifier is as follows:

- Relationship to other Financial Instrument Identifiers
  - A Share Class Global Identifier shall have at least one Composite Global Identifier as a child.

A visual summary of sub clauses 6.3.1 – 6.3.3 is presented below in Figure 6.1.
6.3.6 Pricing Source
The relationship between a Financial Instrument and a Pricing Source is as follows:

- A Financial Instrument may have any number of Pricing Sources, including zero.

As a matter of practice, almost all Financial Instruments have an associated Pricing Source, but there are cases, e.g., some corporate bonds, where this is not the case.

6.3.7 Security Type
The relationship between a Financial Instrument and a Security Type is as follows:

- A Financial Instrument is classified by at least one Security Type.

6.3.8 Ticker
The relationship between a Financial Instrument and a Ticker is as follows:

- A Financial Instrument is identified by at least one Ticker.
7 Controlled Vocabularies

7.1 Introduction

In addition to the basic classes outlined above, there are two sets of named individuals that serve as controlled vocabularies for the classes. While the vocabularies described below and included as a part of the specification are current as of this writing, they are subject to change, through growth, over time.

The process by which the controlled vocabularies changes is directly related to the activities of both the Registration Authority and the Certified Providers (see Annex B).

7.2 Security Types

As specified above, each Global Identifier has at least one Security Type associated with it. The Security Types are specified in the associated SecurityTypes.rdf vocabulary.

Over time, the set of available security types is subject to change. Two events can trigger such a change:

- New security types are invented.
  
  The financial sector is dynamic and new financial instruments are constantly being created. Some are simply variations on existing instruments, e.g., a new mutual fund, but some are genuinely novel. Given the granularity of the security types currently inventoried in this controlled vocabulary, it is likely that new financial instruments will emerge that require a new label.

- The coverage of FIGI expands.
  
  As of the publication of this standard, FIGI covers over 1.5 billion financial instruments. A large number to be sure, but given the granularity of FIGI, e.g., differentiating between AAPL being traded on one exchange as opposed to another, this list is certainly incomplete. Over time, additional financial instruments that simply are not covered at present will be incorporated into FIGI at which point the security type list will need to be expanded.

7.3 Pricing Sources

Like Security Types, there is a known set of individuals that can be used to specify the Pricing Source, as defined in PricingSources.rdf. The pricing sources, while not applicable to all financial instruments, specify the organization that has issued the pricing data for a particular Financial Instrument. Frequently, the organization is a financial services organization such as a Bank. As the pricing source is one of the elements that can serve, it is vital to differentiate one Financial Instrument from another for the purposes of FIGI that this information shall be specified. However, the potential list of pricing sources is subject to grow over time as new organizations enter the business space.

Note, because FIGI also applies to historical data and “retired” financial instruments, there will be no instances where pricing sources specified shall drop off of the list.

1 "Named Individual" is a standard part of both OWL and SKOS and is thus defined within those publicly available specifications.
This page intentionally left blank.
8 FIGI Ontology

8.1 Ontology Architecture and Namespaces

The ontology architecture for FIGI is designed to facilitate ontology extension, evolution, mapping, and reuse to the degree possible. It depends on (1) basic terminology and ontology metadata, such as the OMG Architecture Board’s Specification Metadata recommendation, and (2) may ultimately be mapped to other ontologies such as parts of the Financial Industry Business Ontology (FIBO). The FIGI specification includes two subordinate vocabularies:

- SecurityTypes.rdf, which contains all of the named individuals for security types as of the date of publication, and
- PricingSources.rdf, which contains all of the named individuals for pricing sources as of the date of publication.

The namespaces and their well-known prefixes corresponding to external elements required for use of the FIGI Global Instrument Identifier ontology consist of those listed in Table 8.1, below.

<table>
<thead>
<tr>
<th>Namespace Prefix</th>
<th>Namespace</th>
</tr>
</thead>
<tbody>
<tr>
<td>rdf</td>
<td><a href="http://www.w3.org/1999/02/22-rdf-syntax-ns#">http://www.w3.org/1999/02/22-rdf-syntax-ns#</a></td>
</tr>
<tr>
<td>rdfs</td>
<td><a href="http://www.w3.org/2000/01/rdf-schema#">http://www.w3.org/2000/01/rdf-schema#</a></td>
</tr>
<tr>
<td>owl</td>
<td><a href="http://www.w3.org/2002/07/owl#">http://www.w3.org/2002/07/owl#</a></td>
</tr>
<tr>
<td>xsd</td>
<td><a href="http://www.w3.org/2001/XMLSchema#">http://www.w3.org/2001/XMLSchema#</a></td>
</tr>
<tr>
<td>dct</td>
<td><a href="http://purl.org/dc/terms/">http://purl.org/dc/terms/</a></td>
</tr>
<tr>
<td>skos</td>
<td><a href="http://www.w3.org/2004/02/skos/core#">http://www.w3.org/2004/02/skos/core#</a></td>
</tr>
<tr>
<td>sm</td>
<td><a href="http://www.omg.org/techprocess/ab/SpecificationMetadata/">http://www.omg.org/techprocess/ab/SpecificationMetadata/</a></td>
</tr>
</tbody>
</table>

The namespace approach taken for FIGI is based on OMG guidelines and is constructed as follows:

- The abbreviation for the specification: FIGI
- The ontology or vocabulary name: GlobalInstrumentIdentifiers, SecurityTypes, and PricingSources

Note that the URI/IRI strategy for the ontology and two related vocabularies takes a “slash” rather than “hash” approach, in order to accommodate server-side applications. Though not technically necessary, this specification does mandate namespace prefixes to be used. These are constructed as follows with the components separate by “-“:

- The specification abbreviation: figi
- The ontology or vocabulary abbreviation: gii, st, and ps, respectively.

The namespace itself for this specification is: http://www.omg.org/spec/FIGI/GlobalInstrumentIdentifiers/
The corresponding namespace prefix is figi-gii. The version IRI for the specification is

The namespaces for the subordinate vocabularies are:
- http://www.omg.org/spec/FIGI/PricingSources/
and their corresponding version IRIs are:

8.2 Global Instrument Identifiers Ontology

8.2.1 Ontology Metadata

The FIGI ontologies include metadata that conforms with the Specification Metadata recommendation from the OMG
architecture board. The tables that follow provide the annotation property names and their values for metadata specified
at the ontology level.

8.2.1.1 Specification-Level Metadata

The annotations provided in Table 8.2 include metadata common to the GlobalInstrumentIdentifiers ontology,
SecurityTypes, and PricingSources vocabularies. In every instance, the metadata is specified in the informative about
files rather than in each ontology file.

<table>
<thead>
<tr>
<th>Metadata Term</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

<td>FIGI</td>
</tr>
<tr>
<td>sm:specificationURL</td>
<td><a href="http://www.omg.org/spec/FIGI/">http://www.omg.org/spec/FIGI/</a> or <a href="http://www.omg.org/spec/FIGI/1.0/">http://www.omg.org/spec/FIGI/1.0/</a></td>
</tr>
</tbody>
</table>
| sm:specificationAbstract | A Financial Instrument Global Identifier (FIGI) is a unique, persistent
character string that serves to identify financial instruments. Along with the
identifier, a number of related data points are identified and defined so as to
provide clear context and differentiation of the financial instruments specified
by the identifiers.
The machine consumable OWL file associated with FIGI defines all of the
classes that constitute an identifier as well as the relationships between those
classes so as to provide a comprehensive semantic model for Financial
Instrument Global Identifiers. |
| sm:thisVersion          | 1.0                                                                  |
Revisions to the FIGI specification are managed per the process outlined in the Policies and Procedures for OMG standards, with the intent to maintain backwards compatibility in the ontologies to the degree possible.

The RDF/XML serialized OWL for the Foundations ODM/OWL ontologies have been checked for syntactic errors and logical consistency with Protege 4 (http://protege.stanford.edu/) and HermiT 1.3.8 (http://www.hermiT-reasoner.com), Pellet 2.2 (http://clarkparsia.com/pellet) and RacerPro reasoners for OWL 2 ontologies. Note that Pellet 2.2 cannot process the regex string pattern in the data restriction, however. Users who wish to use Pellet due to other advantages should comment out the restriction on the hasUniqueTextIdentifier property in the definition of FinancialInstrumentIdentifier.

### 8.2.2 Top-Level Class Hierarchy

In addition to this specification, FIGI is provided as an ODM/OWL 2 compliant ontology with two supporting OWL 2 vocabularies. The ontology is defined using the ODM 1.1 stereotypes for RDF and OWL, and is explained via UML diagrams and corresponding tables describing the relevant model elements (the source for which is included as part of this specification in separate machine-readable files).

Each of the classes specified here are direct reflections of the concepts defined in Section 4, 13136.1 and 156.2 with the single exception of Financial Instrument which is defined as follows:

Financial instruments are cash, evidence of an ownership interest in an entity, or a contractual right to receive, or deliver, cash or another financial instrument.

A clarification of this (which is represented as a "note" in the associated model files) is as follows:

Financial instruments can be categorized by form depending on whether they are cash instruments or derivative instruments:

- **Cash instruments** are financial instruments whose value is determined directly by markets. They can be divided into securities, which are readily transferable, and other cash instruments such as loans and deposits, where both borrower and lender have to agree on a transfer.

- **Derivative instruments** are financial instruments which derive their value from the value and characteristics of one or more underlying assets. They can be divided into exchange-traded derivatives and over-the-counter (OTC) derivatives.

Alternatively, financial instruments can be categorized by "asset class" depending on whether they are equity based (reflecting ownership of the issuing entity) or debt based (reflecting a loan the investor...
has made to the issuing entity). If it is debt, it can be further categorized into short term (less than one year) or long term.

Foreign Exchange instruments and transactions are neither debt nor equity based and belong in their own category.

The grouping of Financial Instrument Identifier along with Financial Instrument Name and Ticker into a broader class named Identifier is a reflection of the fact that all three classes contain as individuals things which serve to identify, perhaps not uniquely in some cases, other things, in this case, financial instruments. Figure 8.1 provides the top-level class hierarchy for the model.

![Figure 8.1 - Top-Level Class Hierarchy](image)

Property definitions for all properties in the FIGI ontology are given in Table 8.4.

**Table 8.4 - Property Definitions for the FIGI Ontology**

<table>

</tr>
</tbody>
</table>
### 8.2.3 Financial Instruments

As noted in sub clause 166.3, Financial Instruments, which are at the heart of this specification, stand in a number of relationships to the other classes and subclasses defined in the model. Figure 8.2 depicts these relationships in detail.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>URI</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsIdentified By</td>
<td>relates an entity to an identifier or key that identifies it</td>
<td></td>
<td>owl:Thing</td>
</tr>
<tr>
<td>HasUnique TextIdentifier</td>
<td>links an entity to a unique identifier for that entity; may be associated with anything. With reference to a given (possibly implicit) set of objects, a unique identifier (UID) is any identifier which is guaranteed to be unique among all identifiers used for those objects and for a specific purpose.</td>
<td><a href="https://en.wikipedia.org/wiki/Unique_identifier">https://en.wikipedia.org/wiki/Unique_identifier</a></td>
<td>owl:Thing</td>
</tr>
</tbody>
</table>
Of note in the above diagram, we can see that Financial Instruments participate in three types of relationships:

- ‘has’: indicates that someone (or something) possesses a property such as a characteristic, attribute, feature, capability, and so forth.
- ‘is classified by’: indicates the category is used to classify an entity, in this case, a financial instrument.
- ‘is identified by’: relates an entity, in this case a financial instrument, to a label of some sort that serves as a reference to it (perhaps not uniquely).
The diagram illustrates the following, again as outlined in 176.3.3:

- ‘has’ applies to:
  - financial instrument → exchange code (FI.2.7)
  - financial instrument → pricing source (FI.2.6)
- ‘is classified by’ applies to:
  - financial instrument → security type (FI.2.5)
- ‘is identified by’ applies to:
  - financial instrument → financial instrument name (FI.2.3)
  - financial instrument → ticker (FI.2.4)
  - financial instrument → financial instrument identifier (FI.2.1)

Class expression definitions for all expressions depicted in Figure 8.2, above, are given in Table 8.5.

### Table 8.5 - Class Expression Definitions for Financial Instruments

<table>

</tr>
<tr>
<td>FinancialInstrumentIdentifier</td>
<td>class</td>
<td>financial instrument identifier</td>
<td>A financial instrument identifier is an identifier that identifies (that is, labels the identity of) a financial instrument with a unique, persistent, semantically meaningless ID. The abbreviation 'ID' often refers to identity, identification (the process of identifying), or an identifier (that is, an instance of identification). A financial instrument identifier consists of a 12 digit alphanumeric, randomly generated ID covering active and inactive securities. In total there will be more than 852 billion potential combinations available. The first 3 characters begin with 'xxG'; where 'x' can be any uppercase consonant or 'Y' (with certain restrictions), positions 4-11 are alphanumeric (excluding vowels) and the last digit is a check digit, which is calculated based on a variation of the equivalence.</td>
<td>Identifier, 1.3.2, 1.3.3 (equivalence)</td>
</tr>
</tbody>
</table>
### 8.2.4 Identifiers

Figure 8.3 specifies the ontological relationships between the three varieties of Financial Instrument Identifiers as well as their relationship to Financial Instruments. In every case, the relationships are as specified in 6.3.1 – 6.3.3.
Of note in this diagram is the additional DataTypeRestriction (I.3.3) placed on the Financial Instrument Identifier, in particular:

```
"(?!BS|BM|GG|GB|VG|GH|KY)[BCDFGHJKLMNPQRSTVWXYZ]{2}G[BCDFGHJKLMNPQRSTVWXYZ\d]{8}\d"^^string
```

This regex expression is in place to specify the syntactic restrictions on FIGI as specified in section 6.1. The breakdown is as follows:

- `(?!BS|BM|GG|GB|VG|GH|KY)`: the first two characters cannot be any of the following strings:
  - ‘BS’
  - ‘BM’
  - ‘GG’
  - ‘GB’
  - ‘VG’
  - ‘GH’
  - ‘KY’

- `[BCDFGHJKLMNPQRSTVWXYZ]{2}`: the above condition not-with-standing, the first two characters can be any combination of upper case consonants (including “Y”).
- G: the third character shall be an upper case ‘G’.
• \([BCDFGHJKLMNPQRSTVWXYZ\d]\{8\}]: the next eight characters (positions 4 – 11) can be any upper case consonant or any single digit (trivially 0 – 9) numeral.
• \(\d\): the last character shall be a single digit (trivially 0 – 9) numeral.

What is absent from this DataTypeRestriction is the logic which dictates the calculation of the last character. This is specified in 156.2.2 but is not included in the OWL file as the calculation of the check digit would require an algorithm which is beyond the scope of regular expressions, e.g., javascript. At this point OWL 2.0 cannot support such code.

Class expression definitions for all expressions depicted in Figure 8.3, above, are given in Table 8.6.

<table>

Financial Instrument Global Identifier, v1.1 Beta 2
35
Annex A: Shared Semantics Treatments

(Informative)

The following Annex is intended to provide additional information that practitioners may find useful in understanding the standard. While there may be references to normative sections of the standard, no new requirements are specified below. Rather, background information is provided that will aid in understanding the requirements specified elsewhere.

The Financial Instrument Global Identifier is, in many ways, a complement to FIBO, although not exclusively, and can be complimentary to other ontologies and standards as previously stated. The objective of FIBO includes providing a model of financial instruments as part of the model of the financial industry. The Financial Instrument Global Identifier is not, properly speaking, a part of that. The FIGI model does not specify a conceptual model of the financial instruments themselves, after all. Rather, it provides a concrete model for references, both descriptive and technical, for those instruments. FIGI is also designed to be mapped to the relevant aspects of FIBO as the modules describing financial instruments at the conceptual level become available.

Since the scope of the Financial Instrument Global Identifier is exclusively focused on Financial Instruments, the only part of FIBO that needs careful attention in the context of this standard is the treatment of Financial Instruments. Based on the latest ontology architecture information available for FIBO, definitions for financial instruments will span multiple specifications, each containing a number of modules and individual ontologies, none of which are available as OMG standards as of this writing.
Annex B: Creation of New Identifiers

(Informative)

The following Annex is intended to provide additional information that practitioners may find useful in understanding the standard. While there may be references to normative sections of the standard, no new requirements are specified below. Rather, background information is provided that will aid in understanding the requirements specified elsewhere.

B.1 General

There can be two mechanisms by which an organization other than the designated Registration Authority (RA) can initiate the creation of new identifiers. It is recognized that a single RA individual cannot anticipate all possible market needs for identifiers. And while an RA can certainly provide a broad coverage of the market, there are inevitable market needs that may not be met by the RA.

Financial Instrument Global Identifier, v1.1 Beta 2
needs that will emerge over time. To this end, in addition to establishing additional RAs, two mechanisms for creation of new identifiers are proposed: 1. Request Service. 2. Certified Provider (CP) status. Each is explicated below.

B.2 Request Service

The simplest manner in which a new identifier or a set of new identifiers can be created is through the use of a request service whereby an organization interested in having an identifier or set of identifiers established simply issues a request to the RA which results in the RA creating a new identifier(s).

As has been noted throughout this document, the uniqueness of identifiers is vitally important. This applies not only to the actual twelve-character string used as an identifier, but also to the instrument(s) identified. Simply put, a single financial instrument, appropriately defined, can only have one identifier, as per the rules set out in section 2.1 of the standard. So, in order to issue a new identifier, per section 2.2.1 above:

- Uniqueness of Identifier: the twelve character string (see Clause 6 for details) is unique and has never been used at any time for a FIGI.
- Uniqueness of the Financial Instrument: the financial instrument being identified does not already have a FIGI associated with it.

Meeting the first condition is trivial: since the RA serves as the system of record for all FIGIs, assigning a novel FIGI is merely a matter of creating a new identifier and checking against the existing inventory to ensure that the identifier is new. Exactly how the RA (or a CP, see below) might elect to do this is left open to the organization in question, provided that uniqueness obtains.

Meeting the second condition is much more elaborate than was meeting the first condition. The conceptual model of a financial instrument that has been employed in this standard, however, is key to addressing this issue. As explicated in Section 6 of this standard, a financial instrument is identified by multiple things, is classified by multiple things, and is associated with multiple things. It is this collection of relationships that needs to be understood so as to ensure that a given financial instrument has not already been assigned an identifier. So, the following data points need to be reviewed in order to confirm that the Financial Instrument in question has not yet been assigned an Identifier:

- Name
- Ticker (if applicable)
- Exchange Code
- Pricing Source (if available at the time of the request)
- Security Type

Owing to the diverse nature of financial instruments, it is expected that additional data points will be required, particularly as the coverage provided by FIGI expands, to provide decisive identification of financial instruments. (If such is viewed as necessary by either the Registration Authority or by a Certified Provider, see B.3, a revision of this specification can be initiated or updated during a standard review so as to fully document the additional classes or vocabularies.) In any event, once the uniqueness of the financial instrument is established, then condition 1 can be met by issuing a new identifier.

In order to request a new identifier, therefore, it is necessary that the requester provide the data points corresponding to the above data points (where applicable) so as to identify the financial instrument as well as any additional data points that might be required moving forward. Further, it is incumbent upon the RA to provide a request mechanism that easily accommodates the multi-faceted requests, both in one-off format and in bulk (perhaps with restrictions on the number per request), in a simple and easy to use manner, e.g., a web site, web service or an ftp drop box.
B.3 Certified Provider (CP)

It is recognized that some organizations may have an interest in the creation of such a volume of identifiers that utilizing a request service as outlined in Annex C. is simply insufficient for their needs. This, coupled with the fact that the FIGI standard is an open standard, requires that a set of mechanisms and processes be defined so as to accommodate alternative issuers of identifiers.

Certified Providers are self-identified and nominated (self-nomination included) as potential Certified Providers to both the OMG Financial Services Domain Task Force and the RA. A Financial Services Domain Task Force sub-committee which meets FSDTF quorum requirements, consisting of at least one representative from the RA and at least one OMG member organization that is not the RA (CP evaluation committee) will evaluate the nomination of the CP according to the following criteria:

1. The potential CP should have the necessary infrastructure in place or in a funded, scheduled infrastructure project that is sufficient to:
   a. Scalably store and maintain the repository necessary to provide FIGIs?
   b. Scalably, and with sufficient redundancy, provide only access to the FIGIs it creates?
   c. Provide a sufficiently robust API interface to support the registration of new FIGIs and related items?

2. The potential CP should be committed to providing the above services in perpetuity with no restrictions on redistribution and absolutely no charge to any potential user or organization?

The CP evaluation committee would issue their response to the application within six (6) months/two OMG meetings of the completed application being presented to the Finance Domain Task Force at an OMG meeting. The response will provide appropriate documentation explaining why the decision was made as it was if the outcome is not positive. In the event of a negative outcome, the potential CP is free to reapply for CP status anytime in the future through the above process.

The two conditions outlined above, 1. Uniqueness of the identifier and 2. Novelty of the financial instrument are both highly relevant and, as it happens, a bit more complex in the case of a CP. The complexity stems from the fact that there would only be one comprehensive system of record that can serve to ensure that conditions 1 and 2 are met: the inventory maintained by the RA. To address this complexity, the mechanism and processes by which CPs can create identifiers needs to be considered from both the perspective of the potential CP as well as from the perspective of the RA. We begin with the RA.

B.3.1 Registration Authority (RA) Role

The RA, as the keeper of the comprehensive inventory of identifiers needs to ensure that both conditions 1 and 2 are met prior to an identifier being issued. When the RA itself is issuing an identifier, this is relatively simple as outlined in C.1. When an identifier is requested by a CP, however, the situation is different. Regarding the first condition, the uniqueness of the identifier, an allocation system for two letter prefixes as outlined below in Annex C addresses that easily enough. Regarding condition 2: the uniqueness of the financial instrument requires a bit more effort.

Given the data points associated with a given financial instrument as discussed in C.1, determining if an instrument has already been assigned an identifier within the confines of the RA environment is not overly complex. In the case of a Certified Provider, however, there are two infrastructures at play: the RA infrastructure and the CP infrastructure. So, in order to ensure that the second condition is met, the RA would need to provide an API in order to permit each CP to check their proposed financial instrument against the existing inventory as part of the registration process. As it is possible that two CPs might elect to assign identifiers (trivially different twelve-character strings, see Annex C) within a small window of time, it is necessary that this check occur at the time of registration, which would be after the time when the CP has assigned an identifier string, as opposed to a preliminary step prior to the assignment of the string. This way, at any given time there would be either zero (0) or one (1) twelve-character string assigned to any given financial instrument with no need to “hold” a spot.

Financial Instrument Global Identifier, v1.1 Beta 2

39
B.3.2 Certified Provider (CP) Role

Like the RA, the CP is responsible for ensuring that conditions 1 and 2 of Section 2.1 are met. In this case, however, the CP is not expected to check for conditions 1 and 2 against the entire inventory of financial instruments. Rather, they are only responsible for checking that conditions 1 and 2 are met against their own inventory. Once it is determined that a candidate financial instrument is not already present in the CP's inventory and that the identifier assigned to the instrument is unique within the CP's inventory (again, the uniqueness of identifiers across inventories is assured given the allocation rules specified in Annex C), the CP issues a call to the API provided by the RA to register the financial instrument and the identifier assigned to it. There are three possible outcomes, all of which would be communicated back to the CP:

1. The registration is accepted and the financial instrument and identifier are inserted into the RA's comprehensive inventory thereby making it/them available for use.

2. The registration is rejected because:
   a. The instrument is already present in the comprehensive inventory, in which case the identifier would be communicated back.
   b. The data points provided to describe the instrument was incomplete or otherwise non-computable, in which case the offending data elements would be specified in the communication back.

3. Manual review of the request is required owing to some ambiguity or other issue; in which case an estimated time of resolution will be communicated back (within the constraints of an established SLA). This is expected to be a very rare occurrence and is included here for the sake of logical completeness.

In the event that a registration is rejected because the instrument is already present in the comprehensive inventory, it is up to the CP whether they put the identifier string back into their unused inventory or not. Given that each CP would have an initial allotment of roughly 852 Billion identifiers, inventory control is not a high priority.

B.4 New Security Types and New Pricing Sources

In addition to new identifiers, new Security Types and new Pricing Sources can be created from time to time. The mechanism by which these can be created are entirely parallel to the mechanisms by which new identifiers are created. In particular, as the two conditions necessary for a new identifier: 1. Uniqueness, and 2. Novelty, apply also the Security Types and Pricing Sources, the exact same process is followed:

- The Registration Authority, as the holder of the definitive repository, is responsible for confirming the uniqueness and novelty of each new Security Type and Pricing Source it creates.
- The Certified Provider(s) are responsible for:
  - Confirming the uniqueness and novelty of each new Security Type and Pricing Source it creates against their own inventory.
  - Making a call to the RA's API to confirm the global uniqueness and novelty of the new vocabulary item.
  - It is expected that this process can either stand alone as the registration of a vocabulary item or can be packaged as part of the request process for a new identifier which is such that a new vocabulary item is required to support it.

Annex C: Allocation of Identifier Prefixes

(Informative)
The following Annex is intended to provide additional information that practitioners may find useful in understanding the standard. While there may be references to normative sections of the standard, no new requirements are specified below. Rather, background information is provided that will aid in understanding the requirements specified elsewhere.

The total possible inventory of identifiers is in excess of 600 Trillion. Each two letter prefix can be associated with over 852 Billion identifiers given the logic by which the identifiers are governed. While these numbers are sufficient to give us comfort from a statistical perspective that duplicate identifiers will not be generated, a mechanism by which specific two character prefixes are allocated and managed is necessary to ensure that duplication does not occur across different providers. To this end, the following logic can be employed:

Given that all grandfathered identifiers (those specified prior to the adoption of this standard and numbering over 150 Million) have been generated by a single organization and all begin with the “BB” as the first two letters:

- The organization currently issuing identifiers can continue to issue identifiers using the “BB” prefix until such time as the possible combinations are exhausted or are nearing exhaustion (threshold: 500 Million remaining identifiers) at which point they would select another two letter prefix following the same process as other organizations.

- Other organizations that wish to create identifiers have the opportunity to select a two letter prefix from the unused inventory of two letter prefixes. In order to secure a particular two letter prefix, the following conditions must be met:
  - The organization demonstrates that they either currently have the capacity to deliver identifiers in accordance with the requirements specified concerning issuing authorities or have in place a funded project by which they demonstrate the capacity to deliver identifiers in accordance with the requirements specified concerning issuing authorities within 18 months of approval.
  - The application for a new two letter prefix is presented in writing to both the relevant part of the OMG and the RA at least six (6) months prior to the anticipated approval date.

- If an issuing organization that has secured an identifier does not issue at least one identifier within six months of establishing the operational ability to create identifiers, the two letter prefix would be returned to the open inventory not withstanding any other written agreements between the issuing organization, OMG, and the RA to the contrary.

Once a two letter prefix is established and in use by a particular issuer, the issuer is restricted to issuing identifiers using only that prefix until such time as all of the possible combinations are exhausted or are nearing exhaustion (threshold: 500 Million remaining identifiers) at which point they would be allocated another two letter prefix following the same process as outlined above. There can be cases that result in exceptions to this that should be reviewed when they occur.

The process flow by which CPs are established is as illustrated below:
Annex D: Other Standards in the Financial Space

(Informative)

The following Annex is intended to provide additional information that practitioners may find useful in understanding the standard. While there may be references to normative sections of the standard, no new requirements are specified below. Rather, background information is provided that will aid in understanding the requirements specified elsewhere.

D.1 Introduction

While the Financial Instrument Global Identifier specification is intended as a stand-alone specification which is focused on the integrity of unique, persistent identification of Financial Instruments, the fact remains that there are standards in place at any given time that speak to Financial Instruments and may, therefore, intersect with or overlap with the FIGI specification. The purpose of this annex is to provide some acknowledgement of those facts and to proactively counter any confusion that might arise. To that end, this appendix consists of a listing of the relevant standards and a brief treatment of the relationship between those standards and FIGI. These should aid in understanding the FIGI. Again, as there are constantly emerging and evolving standards, it is expected that this appendix will change over time as part of the revision process.
D.2 ISO 6166 (ISIN)

The ISIN standard overlaps with the FIGI standard in that it too, seeks to assign unique identifiers to Financial Instruments. It differs, however, from the FIGI in a number of critical ways which will be explicated below. Because of the overlap and the differentiation, FIGI and ISIN can be viewed as complementary, rather than competing, standards.

The ISIN and the FIGI differ in three broad ways:

1. Scope: The FIGI provides, both in practice and in future implementation, a much broader scope than does ISIN. In particular, FIGI identifies not only securities, but, potentially, all financial instruments. The reason that the scope is so much broader is a function of purpose: the ISIN is focused on serving as a reference for a fungible instrument at the initial issuance level, which serves a proper and needed function in and of itself. FIGI, in contrast, while capable of serving in that capacity, is focused on providing a consistent and unique data point that serves to identify financial instruments and the different contexts they exist in throughout their lifecycle, so as to enable robust and comprehensive data management and, from that, compliance.

2. Granularity: The ISIN provides a single identifier at the single issued level for a fungible instrument. FIGI, in contrast, provides not only that in the form of the Share Class Global Identifier (hence the overlap), but also at the country level through the Composite Global Identifier, and, where applicable, at the trading venue level as well.

3. Persistence: Corporate actions, such as name changes, acquisitions, corporate relocations, and so on, can result in the need for an ISIN to change. This is not intended as part of the ISO 6166 specification, but is a function of the distributed delivery system for ISINs. Such is not the case with FIGIs in that the characters present in the FIGI string are, with the exception of the check digit, entirely meaningless. As such, there are no inferred references to the currency, market or country location, or company name present in the identifier—a condition which can be present in ISINs depending on the structure of the embedded national number and the country prefix used.

Organizations that are licensed to use ISIN are free to map between FIGI and ISIN at the Global share class level. Indeed, this is a common practice. Owing, however, to licensing restrictions on ISIN (though not on FIGI), such mappings cannot be freely redistributed.

D.3 ISO 10962 (CFI)

The Classification of Financial Instruments (CFI) code is a six character string that serves to classify financial instruments both at a high-level, e.g., debt instruments vs equities, and through their attributes, e.g., fully paid vs partly paid. In a sense, this can be viewed as related to the Security Type vocabulary that is part of the FIGI specification. The mechanism by which the distinctions are made, beyond the top levels, however are very different and so these should be viewed as complementary classification systems.

The mechanism by which CFI distinguishes between Financial Instruments at the granular level is largely a function of the legal distinctions that govern the acquisition and disposition of such instruments. For example, Future Contracts are differentiated by whether the terms are standardized or non-standardized. In contrast, the different security types that inform FIGI reflect the manner(s) in which a financial institution would classify their positions for multiple operational and regulatory reporting purposes, and may be influenced by jurisdiction.

As with other standards, it is possible, for organizations to map their holdings to both the FIGI listing of Security Types and to CFI. Distribution of the CFI mapping is not, however, part of the FIGI specification, nor is it required as part of FIGI compliance within the standard (though it is not precluded).

D.4 ISO 20022 (UNIFI)

ISO 20022 is a messaging standard what specifies the structure of a metadata repository containing descriptions of messages and business processes. The relationship between ISO 20022 and FIGI is an intersecting, rather than overlapping, relationship. In fact, as formally recognized as having a place within ISO 20022, as such. Strictly speaking, however, ISO 20022 and FIGI are entirely independent of one another as they seek to do very different things.
D.5 ISO 10383 (MIC)

The Market Identifier Code (MIC) provides a universal method of identifying exchanges, trading platforms, and regulated or non-regulated markets as sources of prices and related information for Financial Instruments. This function overlaps with parts of FIGI, in particular, the Pricing Source. As with ISIN, there are key differences.

1. Scope: The MIC provides identification of places where securities can be, broadly speaking, bought and sold. As such, it only applies to tradable securities that are exchanged at a venue (broadly understood). The list of pricing sources present in FIGI goes far beyond this to support Financial Instruments that are not exchanged at a venue. In fact, FIGI can support Financial Instruments that are not tradable at all, e.g., an individual person’s home mortgage contract (not currently supported, but under consideration).

2. Embeddedness: The MIC code is a stand-alone code that identifies a Market. As such, it serves a different purpose than does the Pricing Source attribute of FIGI and is definitional different, although there may be similarities. The Pricing Source attribute of FIGI serves as a differentiator of otherwise identical financial instruments and that differentiation is embedded into the Financial Instrument Global Identifier as part of the defining metadata. In the case of the MIC, it can be used in concert with the ISIN for informational purposes, as when used together, the combination can provide a certain context that is usable in certain functions. However, in general, it is not part of the core metadata of the ISIN in this particular circumstance.

D.6 Use with other identifiers and standards

FIGI, as noted in table 8.2, is based on the open source concepts of the MIT Open Source license. As such, they are freely redistributable, can be used, transmitted, databased, stored, enriched or otherwise utilized without restrictions aside from ensuring that the MIT Open Source permissions are included and disclosed. As such, there are no restrictions on associating or ‘mapping’ FIGI or the associated metadata to other standards, using the FIGI in or as part of other standards, or adding these other standards or identifiers as associated metadata within an extended FIGI object.

It should be noted that other standards or identifiers in the marketplace may carry some level of licensing or restrictions under different conditions. These licenses may be incompatible with the MIT Open Source license in some conditions such that users should be aware that the MIT Open Source license would not override or invalidate those licenses or restrictions.

Regardless, use of the FIGI in concert with any of these other licenses does not restrict or otherwise change the MIT Open Source license conditions of FIGI and the associated data covered. Under no conditions would the MIT license be invalidated or otherwise revoked.
